CS10 & CS11 DISASSEMBLY AND REASSEMBLY

(Reference Exploded View on page 3)

▽ DENOTES SPECIAL SERVICE PROCEDURES

DISASSEMBLY PROCEDURE

- 1 Remove the CS10 input gear, by removing the set screw in the pad and driving the idler shaft from the housing. (26, 27)
- 2 Remove the set screws (44) from the bearing cover (5) which hold the drag brake springs (45). Position the housing so that the springs fall from housing.
- 3 Remove the four large socket capscrews (4) which hold the back cover to the PTO housing.
- 4 Position the housing against a bench block and hit the end of the output shaft with a soft face hammer to remove the entire output shaft assembly with bearing cover (5).
- 5 Remove the two pipe plugs (43) from the bearing cover. This exposes the ball bearing assembly within the cover.
- 6 Using a 1/4" punch and alternating between the two holes, drive the bearing and shaft assembly from the bearing cover.
- 7 Using a bearing puller remove the rear bearing (8) by grabbing the drag brake plate (10) and removing both pieces. The bronze brake disk (11) can be removed.
- 8 Insert four 1/4-20 capscrews into the drag brake rotor (12) until they just touch the back of the bell gear. Using an "X" pattern screw the capscrews in at 1/4 turn intervals until the brake rotor is free of the output shaft (29).
- 9 The piston and clutch pack may be serviced without removal of the drag brake. Using snap ring pliers, remove the snap ring (13) located on the output shaft end while gently pushing on the piston cup (24).
- 10 Pull the piston cup (24) from the shaft and the piston (21) will go with it.
- 11 Tap the piston cup on a wood surface to remove the piston.
- 12 Remove the spring (20). The clutch friction discs (18) and spacer discs (19) and inner clutch hub (17) can be removed by pointing the shaft end down.
- 13 With the drag brake removed, the snap rings (13) on this end of the bell gear can be removed with snap ring pliers. This allows the bell gear to be removed towards the closed end. The internal bearing (15) of the bell gear can easily be removed.

DRAG BRAKE AND BELL GEAR REMOVAL

TAPER ROLLER BEARINGS

REASSEMBLY PROCEDURE

- 14 The reassembly of the unit is made in reverse of the disassembly. The re-use of seals, O-Rings and snap rings are not recommended.
- 15 Be sure to lubricate the O-Rings and all bearings upon installation. It is important to position drag brake plate so that input gear clears. This is the reason for the flat sides of the plate. Torque capscrews to the values shown or to the following values.
5/16 capscrews - 18 ft.lb. 3/8 capscrews - 36 ft.lb. 1/4 set screw - 9 ft.lb.
- 16 The Input Gear is replaced as a set which includes the gear, cone spacer, and bearings.
See Table A. Slide this sub-assembly into the housing to line up the idler shaft.
- 17 Tap the idler shaft into the housing and through both bearing races.
- 18 Tap the idler shaft in the reverse direction so that it is flush with the bearing in this assembly. Insert the thickest shim that can be installed by hand in the gap between the bearing and housing. Remove shim and select the next thicker shim and drive it into the gap. Rotating the gear to make sure it easily rotates. The recommended bearing pre-load is .002" to .006" loose. (The cone spacer sets this pre-load and measurement is not required.)
- 19 Tap the idler shaft into position and install set screw.

SOLENOID VALVE INSTALLATION (CS10 ONLY)

- 20 Separate the coil from the valve assembly. Insert the valve cartridge into the rear cover and torque to 20 ft.lb.
- 21 Slip one O-Ring and the coil over the valve. Slip the second O-Ring on.
- 22 Place thread locking compound on the post threads and install nut. Torque the nut 4 to 5 ft.lb. max.
- 23 Place thread sealant on pipe plugs. Torque 10-16 ft.lb.

DRAG BRAKE ADJUSTMENT (CS10 ONLY)

- 24 When installing the rear cover be sure to align the roll pins in the drag brake plate with the holes in the rear cover. **NOTE:** It is important that one of the flat edges of this plate is positioned towards the input gear.
- 25 After the cover has been attached to the housing insert the springs into the holes.
- 26 Insert the setscrew over the spring and turn the screw four (4) full turns.
- 27 Follow the test and adjustment procedures in the CS10 operator's manual.

MODEL NUMBER CONSTRUCTION

CS10 CLUTCH HUB REPLACEMENT

Effective April 1999 the clutch hub supplied in the CS10 Series PTO has the two piece clutch hub as shown on this page. The two piece hub consists of a splined hub and a flange which is held together by a snap ring. Because of this design change the clutch pack stack up has changed as shown on page 3.

Begin by assembling the new Clutch Hub:

1. Place the flange (17b) on to the Clutch Hub (17a) so that the recessed area of the flange is against the splines. Fig. 1.
2. Using snap ring pliers install the Snap Ring (17c) on to the Clutch Hub (17a).
3. The New Clutch Hub requires a new output shaft. Select the appropriate shaft and install the Thrust Washer (17d) against the splines on the output shaft (29). Fig. 2.
4. Hold thrust washer in place with the Snap Ring (13).

06T37932 = 06T36039X ("B")

06T37934 = 06T36073X ("S", "D")
